Material	Symbol	Melting Point °C	Density (bulk, g/cm <sup>3</sup> )	Z-ratio	Temperature °C @ Vapor Pressure (Torr)			Evaporation Method	Crucible Liner	Remarks
					10 <sup>-3</sup>	10 <sup>-6</sup>	10 <sup>-4</sup>			
Aluminum	Al	660	2.7	1.08	677	821	1010	eBeam (XInt)	TiB <sub>2</sub> -TiC, TiB <sub>2</sub> -BN, graphite, BN	High deposition rates possible. Al wets IMCS
Aluminum Antimonide	AlSb	1080	4.3	—	—	—	—	eBeam (fair)	TiB <sub>2</sub> -BN, BN, C, Al <sub>2</sub> O <sub>3</sub>	Co-evaporation is the best approach
Aluminum Arsenide	AlAs	1600	3.7	—	—	—	~1300	eBeam (poor)	TiB <sub>2</sub> -BN, BN, Al <sub>2</sub> O <sub>3</sub>	Co-evaporation can work but typically done with MBE
Aluminum Bromide	AlBr <sub>3</sub>	97	3.01	—	—	—	~50	eBeam (poor)	graphite, W	eBeam or thermal evaporation of anhydrous AlBr <sub>3</sub> powder
Aluminum Carbide	Al <sub>4</sub> C <sub>3</sub>	1400	2.36	—	—	—	~800	eBeam (fair)	graphite, W	eBeam evaporation from powder, but CVD is a better approach
Aluminum 2% Copper	Al2%Cu	640	2.8	—	—	—	—	eBeam (fair)	TiB <sub>2</sub> -TiC, BN	eBeam evaporation of Al-Cu alloys is possible, but sputter deposition is a better approach
Aluminum Fluoride	AlF <sub>3</sub>	1257 sublimes	3.07	—	410	490	700	eBeam (fair)	graphite, Mo, W	Films tend to be porous, but smooth
Aluminum Nitride	AlN	— sublimes	3.26	—	—	—	~1750	eBeam (fair)	TiB <sub>2</sub> -TiC, graphite, BN	Reactive evaporation of Al in N <sub>2</sub> or ammonia partial pressure
Aluminum Oxide (Alumina)	Al <sub>2</sub> O <sub>3</sub>	2045	3.97	0.336	—	—	1550	eBeam (XInt)	W, graphite	Swept beam with low deposition rates (< 3 Å/sec)
Aluminum 2% Silicon	Al2%Si	640	2.6	—	—	—	1010	eBeam (fair)	TiB <sub>2</sub> -TiC, BN	eBeam evaporation of Al-Si alloys is possible, but sputter deposition is a better approach
Antimony	Sb	630	6.68	—	279	345	425	eBeam (fair)	BN, graphite, Al <sub>2</sub> O <sub>3</sub>	As the deposition rate is increased from 3-5 Å/s the grain size decreases and film coverage improves
Antimony Telluride	Sb <sub>2</sub> Te <sub>3</sub>	619	6.5	—	—	—	600	eBeam (fair)	graphite, BN, W	Best results are achieved with powdered source material, relatively high deposition rates can be achieved
Antimony Trioxide	Sb <sub>2</sub> O <sub>3</sub>	656	5.2 or 5.76	—	—	—	~300	eBeam (good)	BN, Al <sub>2</sub> O <sub>3</sub>	eBeam evaporation from powder or granules
Antimony Triselenide	Sb <sub>2</sub> Se <sub>3</sub>	611	—	—	—	—	—	eBeam (fair)	graphite	Can be co-evaporated with Se to overcome variable stoichiometric effects
Antimony Trisulphide	Sb <sub>2</sub> S <sub>3</sub>	550	4.64	—	—	—	~200	eBeam (good)	Al <sub>2</sub> O <sub>3</sub> , Mo, Ta	Films without substrate heating are amorphous, while polycrystalline films form on heated substrates
Arsenic	As	814	5.73	—	107	150	210	eBeam (poor)	Al <sub>2</sub> O <sub>3</sub> , BeO, graphite	Sputter deposition is the preferred method for deposition of elemental arsenic
Arsenic Selenide	As <sub>2</sub> Se <sub>3</sub>	360	4.75	—	—	—	—	eBeam (poor)	Al <sub>2</sub> O <sub>3</sub> , quartz	Deposition efficiency increases with deposition rate
Arsenic Trisulphide	As <sub>2</sub> S <sub>3</sub>	300	3.43	—	—	—	~400	eBeam (fair)	Al <sub>2</sub> O <sub>3</sub> , quartz, Mo	Thin films tend to be richer in As compared to the source material
Arsenic Tritelluride	As <sub>2</sub> Te <sub>3</sub>	362	—	—	—	—	—	eBeam (poor)	Al <sub>2</sub> O <sub>3</sub> , quartz	CVD is the preferred deposition technique for this material
Barium	Ba	710	3.78	—	545	627	735	eBeam (fair)	W, Ta, Mo	Reacts with ceramics. Ba evaporation pellets are often shipped with protective coatings which must be removed
Barium Chloride	BaCl <sub>2</sub>	962	3.86	—	—	—	~650	eBeam (poor)	W, Mo	Swept beam and slow power ramp to precondition and outgas the source material
Barium Fluoride	BaF <sub>2</sub>	1280	4.83	—	—	—	~700	eBeam (fair)	W, Mo	Better consistency in refractive index is achieved via CVD
Barium Oxide	BaO	1923	5.72 or 5.32	—	—	—	~1300	eBeam (fair)	Al <sub>2</sub> O <sub>3</sub> , quartz	Swept beam and slow power ramp to precondition and outgas the source material
Barium Sulphide	BaS	2200	4.25	—	—	—	1100	eBeam (poor)	W, Mo	Sputter deposition is the preferred deposition technique
Barium Titanate	BaTiO <sub>3</sub>	Decomposes	6	—	Decomposes			eBeam (poor)	W, Mo	BaTiO <sub>3</sub> will decompose as single source. Co-evaporate with Ti to maintain Ba/Ti ratio

Material	Symbol	Melting Point °C	Density (bulk, g/cm <sup>3</sup> )	Z-ratio	Temperature °C @ Vapor Pressure (Torr)			Evaporation Method	Crucible Liner	Remarks
					10 <sup>-3</sup>	10 <sup>-6</sup>	10 <sup>-4</sup>			
Beryllium	Be	1278	1.85	—	710	878	1000	eBeam (XInt)	graphite	Very high deposition rates are possible. Avoid Be powder sources due to toxicity
Beryllium Chloride	BeCl <sub>2</sub>	440	1.9	—	—	—	~150	eBeam (poor)	graphite	CVD is the preferred deposition technique for this material
Beryllium Fluoride	BeF <sub>2</sub>	800	1.99	—	—	—	~200	eBeam (fair)	graphite	Avoid powder sources due to toxicity
Beryllium Oxide	BeO	2530	3.01	—	—	—	1900	eBeam (fair)	graphite, Al <sub>2</sub> O <sub>3</sub>	Thin films can also be produced via reactive evaporation of Be with O <sub>2</sub>
Bismuth	Bi	271	9.8	—	330	410	520	eBeam (XInt)	Al <sub>2</sub> O <sub>3</sub> , graphite	Post deposition thermal annealing significantly enhances film properties. However, vapors are toxic
Bismuth Fluoride	BiF <sub>3</sub>	727	8.75	—	—	—	~300	eBeam (poor)	graphite	Sublimes at relatively low temperature, so reasonable vapor pressure can be achieved
Bismuth Oxide	Bi <sub>2</sub> O <sub>3</sub>	820	8.9	—	—	—	~1400	eBeam (poor)	—	eBeam evaporation from Bi <sub>2</sub> O <sub>3</sub> source is possible, but variations in thin film stoichiometry may occur
Bismuth Selenide	Bi <sub>2</sub> Se <sub>3</sub>	710	7.66	—	—	—	~650	eBeam (fair)	graphite, quartz	Sputter deposition is preferred, but co-evaporation using Bi and Se sources is possible
Bismuth Telluride	Bi <sub>2</sub> Te <sub>3</sub>	585	7.85	—	—	—	~600	eBeam (fair)	graphite, quartz	Sputter deposition is preferred, but co-evaporation using Bi and Te sources is possible
Bismuth Titanate	Bi <sub>2</sub> Ti <sub>2</sub> O <sub>7</sub>	—	—	—	Decomposes			eBeam (poor)	graphite, quartz	Decomposes when evaporated. Sputter deposition is preferred, but can be reactively co-evaporated in O <sub>2</sub> partial pressure
Bismuth Trisulphide	Bi <sub>2</sub> S <sub>3</sub>	685	7.39	—	—	—	—	eBeam (poor)	graphite, W	Can be co-evaporated from Bi and S sources
Boron	B	2100	2.36	0.389	1278	1548	1797	eBeam (XInt)	graphite, W	Can react with graphite and tungsten crucible liners. Requires high power to evaporate
Boron Carbide	B <sub>4</sub> C	2350	2.5	—	2500	2580	2650	eBeam (good)	graphite, W	Ion assisted eBeam deposition with Ar can improve film adhesion
Boron Nitride	BN	2300	2.2	—	—	—	~1600	eBeam (poor)	graphite, W	Ion assisted eBeam deposition with N <sub>2</sub> produces stoichiometric thin films, but sputter deposition is preferred
Boron Oxide	B <sub>2</sub> O <sub>3</sub>	460	1.82	—	—	—	~1400	eBeam (good)	W, Mo	eBeam evaporation from bulk source material produces stoichiometric thin films
Boron Trisulphide	B <sub>2</sub> S <sub>3</sub>	310	1.55	—	—	—	800	eBeam (poor)	graphite	—
Cadmium	Cd	321	8.64	—	64	120	180	eBeam (fair)	Al <sub>2</sub> O <sub>3</sub> , quartz	Dedicated system is recommended, since Cd can contaminate other purity sensitive depositions
Cadmium Antimonide	CdSb	456	6.92	—	—	—	—	—	—	—
Cadmium Arsenide	Cd <sub>3</sub> As <sub>2</sub>	721	6.21	—	—	—	—	eBeam (poor)	quartz	Thin films can be produced by eBeam evaporation from bulk source material, but CVD is a preferred deposition method
Cadmium Bromide	CdBr <sub>2</sub>	567	5.19	—	—	—	~300	—	—	—
Cadmium Chloride	CdCl <sub>2</sub>	570	4.05	—	—	—	~400	—	—	—
Cadmium Fluoride	CdF <sub>2</sub>	1070	5.64	—	—	—	~500	—	—	—
Cadmium Iodide	CdI <sub>2</sub>	400	5.3	—	—	—	~250	—	—	CdI <sub>2</sub> films have been deposited by thermal evaporation on glass substrates using stoichiometric powders
Cadmium Oxide	CdO	900	6.95	—	—	—	~530	eBeam (poor)	Al <sub>2</sub> O <sub>3</sub> , quartz	Can be produced by reactive evaporation of Cd in partial pressure of O <sub>2</sub> or reactive sputtering with O <sub>2</sub>
Cadmium Selenide	CdSe	1264	5.81	—	—	—	540	eBeam (good)	Al <sub>2</sub> O <sub>3</sub> , quartz, graphite	eBeam evaporation from bulk source material produces uniform films

Material	Symbol	Melting Point °C	Density (bulk, g/cm <sup>3</sup> )	Z-ratio	Temperature °C @ Vapor Pressure (Torr)			Evaporation Method	Crucible Liner	Remarks
					10 <sup>-3</sup>	10 <sup>-6</sup>	10 <sup>-4</sup>			
Cadmium Silicide	CdSiO <sub>2</sub>	—	—	—	—	—	~600	—	—	Reports in the literature of deposition by CVD
Cadmium Sulphide	CdS	1750	4.82	—	—	—	550	eBeam (fair)	Al <sub>2</sub> O <sub>3</sub> , quartz, graphite	Substrate heating improves film adhesion. Deposition rates of 15 Å/sec are possible
			sublimes							
Cadmium Telluride	CdTe	1098	6.2	—	—	—	450	eBeam (fair)	Al <sub>2</sub> O <sub>3</sub> , quartz, graphite	High quality CdTe thin films on glass substrates at 100°C have been fabricated with eBeam deposition
Calcium	Ca	842	1.56	—	272	357	459	eBeam (poor)	Al <sub>2</sub> O <sub>3</sub> , quartz	Low partial pressure of O <sub>2</sub> in the vacuum chamber is required to avoid oxidizing the Ca
			sublimes							
Calcium Fluoride	CaF <sub>2</sub>	1360	3.18	—	—	—	~1100	eBeam (XInt)	quartz, Ta	Deposition rate of 20 Å/sec are easily achieved with eBeam deposition. Substrate heating improves film quality
Calcium Oxide	CaO	2580	3.35	—	—	—	~1700	eBeam (poor)	ZrO <sub>2</sub> , graphite	Forms volatile oxides with W and Mo
Calcium Silicate	CaO-SiO <sub>2</sub>	1540	2.9	—	—	—	—	eBeam (good)	quartz	Post deposition thermal annealing at 500°C improves film quality and adhesion
Calcium Sulphide	CaS	—	2.18	—	—	—	1100	eBeam (poor)	ZrO <sub>2</sub> , graphite	Decomposition of CaS bulk source material can be overcome by co-evaporation with S
		sublimes								
Calcium Titanate	CaTiO <sub>3</sub>	1975	4.1	—	1490	1600	1690	eBeam (poor)	—	Sputter deposition is the preferred method
Calcium Tungstate	CaWO <sub>4</sub>	1620	6.06	—	—	—	—	eBeam (good)	W, ZrO <sub>2</sub>	Substrate heating improves the crystallinity of the deposit
Carbon (diamond)	C	—	1.8-2.3	0.22	1657	1867	2137	eBeam (XInt)	graphite, W	Better film adhesion results from eBeam evaporation compared to vacuum arc deposition
		sublimes			sublimes					
Cerium	Ce	795	8.23	—	970	1150	1380	eBeam (good)	Al <sub>2</sub> O <sub>3</sub> , BeO, graphite	Ce deposits readily oxidize when exposed to air
Ceric Oxide	CeO <sub>2</sub>	2600	7.3	—	1890	2000	2310	eBeam (good)	graphite, Ta	Stoichiometric films are best achieved using reactive evaporation with O <sub>2</sub> . Substrate heating improves film quality
					sublimes					
Cerium Fluoride	CeF <sub>3</sub>	1418	6.16	—	—	—	~900	eBeam (good)	Mo, Ta, W	Can be produced using bulk source material. Substrate heating from 150-300°C improves adhesion and film quality
Cerium Oxide	Ce <sub>2</sub> O <sub>3</sub>	1692	6.87	—	—	—	—	eBeam (fair)	graphite, Ta	Mixed CeO <sub>2</sub> -Ce <sub>2</sub> O <sub>3</sub> films can be reduced to Ce <sub>2</sub> O <sub>3</sub> by heating in UHV at 725°C
Cesium	Cs	28	1.87	—	-16	22	30	eBeam (poor)	quartz	—
Cesium Bromide	CsBr	636	4.44	—	—	—	~400	—	—	—
Cesium Chloride	CsCl	646	3.97	—	—	—	~500	—	—	—
Cesium Fluoride	CsF	684	3.59	—	—	—	~500	—	—	—
Cesium Hydroxide	CsOH	272	3.67	—	—	—	~550	—	—	—
Cesium Iodide	CsI	621	4.51	—	—	—	~500	eBeam (poor)	quartz, Pt	Stoichiometric CsI films are possible from bulk, source material, but good film coverage can be a challenge
Chiolote	Na <sub>2</sub> Al <sub>3</sub> F <sub>14</sub>	—	2.9	—	—	—	~800	eBeam (poor)	Al <sub>2</sub> O <sub>3</sub>	Stoichiometric chiolite films are difficult to fabricate with eBeam evaporation
Chromium	Cr	1890	7.2	0.305	837	977	1157	eBeam (good)	W, graphite	Films are very adherent. High deposition rates possible, but uniformity can be an issue
					sublimes					
Chromium Boride	CrB	2760	6.17	—	—	—	—	—	—	—
Chromium Bromide	CrBr <sub>2</sub>	842	4.36	—	—	—	550	—	—	—
Chromium Carbide	Cr <sub>3</sub> C <sub>2</sub>	1890	6.68	—	—	—	~2000	eBeam (fair)	W	Can be fabricated by co-evaporation of Cr and C
Chromium Chloride	CrCl <sub>2</sub>	824	2.75	—	—	—	550	—	—	—

Material	Symbol	Melting Point °C	Density (bulk, g/cm <sup>3</sup> )	Z-ratio	Temperature °C @ Vapor Pressure (Torr)			Evaporation Method	Crucible Liner	Remarks
					10 <sup>-3</sup>	10 <sup>-6</sup>	10 <sup>-4</sup>			
Chromium Oxide	Cr <sub>2</sub> O <sub>3</sub>	2435	5.21	—	—	—	~2000	eBeam (good)	W	Stoichiometry can be maintained by reactive evaporation in O <sub>2</sub>
Chromium Silicide	Cr <sub>3</sub> Si	1710	6.51	—	—	—	—	—	—	—
Chromium Silicon Monoxide	Cr-SiO	Influenced by Composition						eBeam (good)	W	The quality Cr-SiO cermet films fabricated with eBeam evaporation improves with annealing at 425° C
Cobalt	Co	1495	8.9	—	850	990	1200	eBeam (XInt)	Al <sub>2</sub> O <sub>3</sub> , BeO, graphite	Pellets or powder both work well as source material
Cobalt Bromide	CoBr <sub>2</sub>	678	4.91	—	—	—	400	—	—	—
					sublimes					
Cobalt Chloride	CoCl <sub>2</sub>	740	3.36	—	—	—	472	—	—	—
					sublimes					
Cobalt Oxide	CoO	1935	5.68	—	—	—	—	eBeam (fair)	—	CoO can be fabricated by reactive evaporation with O <sub>2</sub> , but sputter deposition is the preferred fabrication method
Copper	Cu	1083	8.92	0.437	727	857	1017	eBeam (XInt)	Al <sub>2</sub> O <sub>3</sub> , Mo Ta, graphite	Poor adhesion on most substrates. Use thin adhesion layer of Cr or Ti
Copper Chloride	CuCl	422	3.53	—	—	—	~600	eBeam (poor)	quartz	Stoichiometric CuCl films have been produced from pellets and powder source material
Copper Oxide	Cu <sub>2</sub> O	1235	6	—	—	—	~600	eBeam (good)	graphite, Al <sub>2</sub> O <sub>3</sub> , Ta	Thin films have been fabricated from stoichiometric Cu <sub>2</sub> O powder
					sublimes					
Copper Sulfide	CuS	1113	6.75	—	—	—	~500	—	—	—
					sublimes					
Cryolite	Na <sub>3</sub> AlF <sub>6</sub>	1000	2.9	—	1020	1260	1480	eBeam (good)	W, graphite	Good films can be fabricated using pellets or powder source material.
Dyprosium	Dy	1409	8.54	—	625	750	900	eBeam (good)	W	Quality thin films can be fabricated from bulk source material
Dyprosium Fluoride	DyF <sub>3</sub>	1360	6	—	—	—	~800	eBeam (good)	W, Ta	Bulk source material is available in pellets and powder form
					sublimes					
Dyprosium Oxide	Dy <sub>2</sub> O <sub>3</sub>	2340	7.81	—	—	—	~1400	eBeam (fair)	W	Thin films have been fabricated from bulk source material
Erbium	Er	1497	9.06	0.74	650	775	930	eBeam (good)	W, Ta	—
					sublimes					
Erbium Fluoride	ErF <sub>2</sub>	1380	6.5	—	—	—	~950	—	—	—
Erbium Oxide	Er <sub>2</sub> O <sub>3</sub>	2400	8.64	—	—	—	~1600	eBeam (fair)	W	Reactive evaporation of bulk material in O <sub>2</sub> atmosphere maintains stoichiometry.
Europium	Eu	822	5.26	—	280	360	480	eBeam (fair)	Al <sub>2</sub> O <sub>3</sub>	—
					sublimes					
Europium Fluoride	EuF <sub>2</sub>	1380	6.5	—	—	—	~950	—	—	—
Europium Oxide	Eu <sub>2</sub> O <sub>3</sub>	2400	8.64	—	—	—	~1600	eBeam (good)	W	Reactive evaporation of Eu <sub>2</sub> O <sub>3</sub> powder or granules in O <sub>2</sub> atmosphere maintains stoichiometry.
Europium Sulphide	EuS	—	5.75	—	—	—	—	eBeam (good)	W	eBeam evaporation of EuS powder in UHV (10 <sup>-8</sup> torr base vacuum) has been reported in the literature
Gadolinium	Gd	1312	7.89	—	760	900	1175	eBeam (XInt)	Al <sub>2</sub> O <sub>3</sub> , W	eBeam evaporation of Gd directly from the water cooled Cu hearth has been reported
Gadolinium Oxide	Gd <sub>2</sub> O <sub>3</sub>	2310	7.41	—	—	—	—	eBeam (fair)	Al <sub>2</sub> O <sub>3</sub> , W	Reactive evaporation of Gd <sub>2</sub> O <sub>3</sub> pellets in O <sub>2</sub> maintains thin film stoichiometry. Refractive index increases with substrate heating
Gallium	Ga	30	5.9	—	619	742	907	eBeam (good)	graphite, Al <sub>2</sub> O <sub>3</sub> , BeO, quartz	Alloys with refractory metals
Gallium Antimonide	GaSb	710	5.6	—	—	—	—	eBeam (fair)	W, Ta	eBeam evaporation from bulk source material is possible

Material	Symbol	Melting Point °C	Density (bulk, g/cm <sup>3</sup> )	Z-ratio	Temperature °C @ Vapor Pressure (Torr)			Evaporation Method	Crucible Liner	Remarks
					10 <sup>-3</sup>	10 <sup>-6</sup>	10 <sup>-4</sup>			
Gallium Arsenide	GaAs	1238	5.3	—	—	—	—	eBeam (good)	graphite, W	Film quality is improved with ion assisted evaporation
Gallium Nitride	GaN	—	6.1	—	—	—	~200	eBeam (fair)	graphite, Al <sub>2</sub> O <sub>3</sub> , BeO, quartz	Reactive evaporation of Ga in 10 <sup>-3</sup> N <sub>2</sub>
		sublimes								
Gallium Oxide (β)	Ga <sub>2</sub> O <sub>3</sub>	1900	5.88	—	—	—	—	eBeam (fair)	graphite, W	Reactive evaporation of Ga <sub>2</sub> O <sub>3</sub> in O <sub>2</sub> partial pressure maintains stoichiometry
Gallium Phosphide	GaP	1540	4.1	—	—	770	920	eBeam (fair)	quartz, W	Co-evaporation of Ga and P has been reported
Germanium	Ge	937	5.35	0.516	812	957	1167	eBeam (XInt)	Al <sub>2</sub> O <sub>3</sub> , quartz, graphite, Ni	Uniform films achieved with slow power ramp and swept beam
Germanium Nitride	Ge <sub>3</sub> N <sub>2</sub>	450	5.2	—	—	—	~650	eBeam (poor)	—	Sputtering is the preferred method of fabrication
					sublimes					
Germanium Oxide	GeO <sub>2</sub>	1086	6.24	—	—	—	~625	eBeam (good)	graphite, Al <sub>2</sub> O <sub>3</sub> , quartz	GeO <sub>2</sub> stoichiometry can be maintained by reactive evaporation of bulk source material in O <sub>2</sub>
Germanium Telluride	GeTe	725	6.2	—	—	—	381	—	—	—
Gold	Au	1062	19.32	0.381	807	947	1132	eBeam (XInt)	W, Al <sub>2</sub> O <sub>3</sub> , graphite, BN	Metal spitting can be an issue. Mitigate by slow power ramp with swept beam and low carbon content in source material
Hafnium	Hf	2230	13.09	—	2160	2250	3090	eBeam (good)	W	—
Hafnium Boride	HfB <sub>2</sub>	3250	10.5	—	—	—	—	—	—	Fabrication of HfB <sub>2</sub> films by CVD has been reported
Hafnium Carbide	HfC	4160	12.2	—	—	—	~2600	—	—	—
					sublimes					
Hafnium Nitride	HfN	2852	13.8	—	—	—	—	—	—	HfN films have been produced by reactive RF sputtering of Hf in N <sub>2</sub> + Ar
Hafnium Oxide	HfO <sub>2</sub>	2812	9.68	—	—	—	~2500	eBeam (fair)	graphite, W	Can be fabricated by reactive evaporation in O <sub>2</sub> or using bulk source material. Post process annealing at 500°C improves film quality
Hafnium Silicide	HfSi <sub>2</sub>	1750	7.2	—	—	—	—	eBeam (fair)	W	HfSi <sub>2</sub> thin films have been fabricated by eBeam evaporation of Hf on Si substrates followed by annealing at 750°C for an hour
Holmium	Ho	1470	8.8	—	650	770	950	eBeam (good)	W	—
					sublimes					
Holmium Fluoride	HoF <sub>3</sub>	1143	7.64	—	—	—	~800	—	quartz	—
Holmium Oxide	Ho <sub>2</sub> O <sub>3</sub>	2370	8.41	—	—	—	—	eBeam (fair)	W	Ho <sub>2</sub> O <sub>3</sub> thin films have been fabricated by eBeam evaporation of powdered source material or reactive evaporation of Ho in O <sub>2</sub>
Indium	In	157	7.3	0.841	487	597	742	eBeam (XInt)	Mo, graphite, Al <sub>2</sub> O <sub>3</sub>	Wets Cu and W. Mo liner is preferred
Indium Antimonide	InSb	535	5.8	—	500	—	~400	eBeam (fair)	graphite, W	Thin films fabricated using powdered source material
Indium Arsenide	InAs	943	5.7	—	780	870	970	—	—	Sputter deposition is the preferred thin film fabrication technique
Indium Oxide	In <sub>2</sub> O <sub>3</sub>	1565	7.18	—	—	—	~1200	eBeam (good)	Al <sub>2</sub> O <sub>3</sub>	Thin films have been produced by reactive evaporation of powdered In <sub>2</sub> O <sub>3</sub> in O <sub>2</sub> partial pressure.
					sublimes					
Indium Phosphide	InP	1058	4.8	—	—	630	730	eBeam (fair)	graphite, W	Deposits are P rich
Indium Selenide	In <sub>2</sub> Se <sub>3</sub>	890	5.7	—	—	—	—	eBeam (fair)	graphite, W	Thin films have been fabricated by eBeam evaporation from powdered InSe. Post process annealing improves crystallinity
Indium Sesquisulphide	In <sub>2</sub> S <sub>3</sub>	1050	4.9	—	—	—	850	—	—	—
					sublimes					

Material	Symbol	Melting Point °C	Density (bulk, g/cm <sup>3</sup> )	Z-ratio	Temperature °C @ Vapor Pressure (Torr)			Evaporation Method	Crucible Liner	Remarks	
					10 <sup>-3</sup>	10 <sup>-6</sup>	10 <sup>-4</sup>				
Indium Sulphide	In <sub>2</sub> S	653	5.87	—	—	—	650	—	—	—	
Indium Telluride	In <sub>2</sub> Te <sub>3</sub>	667	5.8	—	—	—	—	—	—	Thin films from co-evaporation of In and Te sources has been reported.	
Indium Tin Oxide	In <sub>2</sub> O <sub>3</sub> -SnO <sub>2</sub>	1800	6.43-7.14	—	—	—	—	eBeam (good)	graphite	Thin films have been produced from 90% In <sub>2</sub> O <sub>3</sub> -10%SnO <sub>2</sub> powder in O <sub>2</sub> partial pressure. Substrate temperature of 250°C improves electrical conductivity of resulting films	
Iridium	Ir	2459	22.65	—	1850	2080	2380	eBeam (fair)	W	Better uniformity and adhesion can be achieved using sputter deposition	
Iron	Fe	1535	7.86	0.349	858	998	1180	eBeam (XInt)	Al <sub>2</sub> O <sub>3</sub> , BeO, graphite	Molten Fe will attack and adhere to graphite, severely limiting crucible liner life

Thallium Chloride	TlCl	430	7	—	—	—	~150	—	—	—
					sublimes					
Thallium Iodide (β)	TlI	440	7.09	—	—	—	~250	eBeam (poor)	Al <sub>2</sub> O <sub>3</sub> , quartz	Low stress thin films can be produced by eBeam evaporation with a substrate temperature of 100°C
Thallium Oxide	Tl <sub>2</sub> O <sub>3</sub>	717	9.65	—	—	—	350	—	—	Disproportionates at 850°C to Tl <sub>2</sub> O
Thorium	Th	1875	11.7	—	1430	1660	1925	eBeam (XInt)	W, Ta, Mo	Toxic and mildly radioactive
Thorium Bromide	ThBr <sub>4</sub>	—	5.67	—	—	—	—	—	—	—
					sublimes					
Thorium Carbide	ThC <sub>2</sub>	2273	8.96	—	—	—	~2300	—	—	—
Thorium Dioxide	ThO <sub>2</sub>	3050	10.03	—	—	—	~2100	eBeam (good)	W	Stable stoichiometric films of ThO <sub>2</sub> produced from powdered source material have been reported

Material	Symbol	Melting Point °C	Density (bulk, g/cm <sup>3</sup> )	Z-ratio	Temperature °C @ Vapor Pressure (Torr)			Evaporation Method	Crucible Liner	Remarks
					10 <sup>-3</sup>	10 <sup>-6</sup>	10 <sup>-4</sup>			
Thorium Fluoride	ThF <sub>4</sub>	1110	6.3	—	—	—	~750	eBeam (fair)	Ta, Mo, graphite	Use gentle preheat to outgas. Substrate temperature of 175°C improves film adhesion and quality
Thorium Oxyfluoride	ThOF <sub>2</sub>	900	9.1	—	—	—	—	eBeam (poor)	W, Ta, Mo, graphite	Does not evaporate stoichiometrically, resulting films are primarily ThF <sub>4</sub>
Thorium Sulphide	ThS <sub>2</sub>	—	6.8	—	—	—	—	—	—	—
Thulium	Tm	1545	9.32	—	461	554	680	eBeam (good)	Al <sub>2</sub> O <sub>3</sub>	—
					sublimes					
Thulium Oxide	Tm <sub>2</sub> O <sub>3</sub>	—	8.9	—	—	—	1500	—	—	Thin films of Tm <sub>2</sub> O <sub>3</sub> by eBeam evaporation and MBE have been reported
Tin	Sn	232	7.75	0.724	682	807	997	eBeam (XInt)	Al <sub>2</sub> O <sub>3</sub> , Ta, graphite, W	High deposition rates possible, but uniformity may suffer. Slow power ramp to mitigate cavitation of melt pool
Tin Oxide	SnO <sub>2</sub>	1127	6.95	—	—	—	~1000	eBeam (XInt)	Al <sub>2</sub> O <sub>3</sub> , quartz	Substrate temperature above 200°C improves film crystallinity
					sublimes					
Tin Selenide	SnSe	861	6.18	—	—	—	~400	—	—	Stoichiometric thin films of SnSe produced by thermal evaporation of powdered source material have been reported
Tin Sulphide	SnS	882	5.08	—	—	—	~450	eBeam (poor)	quartz, W	Thin films prepared by eBeam evaporation of SnS powder and reactive co-evaporation of Sn and S have been reported
Tin Telluride	SnTe	780	6.44	—	—	—	~450	eBeam (poor)	quartz	Thin films of SnTe produced with eBeam evaporation at a substrate temperature of 300°C have been reported
Titanium	Ti	1675	4.5	0.628	1067	1235	1453	eBeam (XInt)	W, graphite, TiC	Films are very adherent to almost any substrate
Titanium Boride	TiB <sub>2</sub>	2980	4.5	—	—	—	—	—	—	Sputter deposition is the preferred thin film fabrication technique
Titanium Carbide	TiC	3140	4.93	—	—	—	~2300	eBeam (fair)	W, graphite	eBeam evaporation of TiC thin films with and without ion beam assistance have been reported
Titanium Dioxide	TiO <sub>2</sub>	1640	4.29	—	—	—	~1300	eBeam (good)	W, graphite, Ta	Stoichiometric thin films of TiO <sub>2</sub> have been produced from powder source material and a substrate temperature of 600°C
Titanium Monoxide	TiO	1750	—	—	—	—	~1500	eBeam (good)	W, graphite, Ta	Outgas with gentle preheat prior to deposition
Titanium Nitride	TiN	2930	5.43	—	—	—	—	eBeam (good)	W, graphite, TiC	Thin films have been prepared by reactive evaporation of Ti in N <sub>2</sub> partial pressure
Titanium Sesquioxide	Ti <sub>2</sub> O <sub>3</sub>	2130	4.6	—	—	—	—	eBeam (good)	W, Ta, graphite	Stoichiometric films have been produced by reactive evaporation of Ti <sub>2</sub> O <sub>3</sub> powder in 2.5 x 10 <sup>-4</sup> torr O <sub>2</sub>
Tungsten	W	3410	19.3	0.163	2117	2407	2757	eBeam (good)	W	Long, slow preheat is required to condition the source material. Raster the electron beam to avoid hole drilling
Tungsten Boride	WB <sub>2</sub>	2900	12.75	—	—	—	—	—	—	—
Tungsten Carbide	W <sub>2</sub> C	2860	17.15	—	1480	1720	2120	eBeam (good)	W, graphite	Thin films prepared by eBeam evaporation of powdered source material have been reported. RF Sputter deposition is widely reported
Tungsten Telluride	WTe <sub>3</sub>	—	9.49	—	—	—	—	—	—	—
Tungsten Trioxide	WO <sub>3</sub>	1473	7.16	—	—	—	980	eBeam (good)	W	Thin films are most commonly prepared using WO <sub>3</sub> powder source material
					sublimes					
Uranium	U	1132	19.07	—	1132	1327	1582	eBeam (good)	W, Mo, graphite	Depleted uranium thin films oxidize easily even in low partial pressure of O <sub>2</sub>
Uranium Carbide	UC <sub>2</sub>	2260	11.28	—	—	—	2100	—	—	—

Material	Symbol	Melting Point °C	Density (bulk, g/cm <sup>3</sup> )	Z-ratio	Temperature °C @ Vapor Pressure (Torr)			Evaporation Method	Crucible Liner	Remarks
					10 <sup>-3</sup>	10 <sup>-6</sup>	10 <sup>-4</sup>			
Uranium Dioxide	UO <sub>2</sub>	2176	10.9	—	—	—	—	eBeam (fair)	W	Stoichiometric thin films produced by reactive evaporation of depleted uranium in O <sub>2</sub> partial pressure have been reported
Uranium Fluoride	UF <sub>4</sub>	~1000	—	—	—	—	300	—	—	Thin films fabricated by sputter deposition of depleted uranium by F <sup>-</sup> ions has been reported
Uranium Oxide	U <sub>3</sub> O <sub>8</sub>	Decomposes	8.3	—	—	—	—	—	—	Thin films produced by reactive sputter deposition of depleted uranium targets in O <sub>2</sub> have been reported.
Uranium Phosphide	UP <sub>2</sub>	—	8.57	—	—	—	1200	—	—	—
Uranium Sulphide	U <sub>2</sub> S <sub>3</sub>	—	—	—	—	—	1400	—	—	—
Vanadium	V	1890	5.96	—	1162	1332	1547	eBeam (XInt)	W, graphite, Ta	Wets Mo. eBeam evaporation is preferred
Vanadium Boride	VB <sub>2</sub>	2400	5.1	—	—	—	—	—	—	—
Vanadium Carbide	VC	2810	5.77	—	—	—	~1800	—	—	—
Vanadium Dioxide	VO <sub>2</sub>	1967	4.34	—	—	—	~575	eBeam (poor)	W, graphite	Difficult to maintain stoichiometry by eBeam evaporation, sputter deposition is preferred
Vanadium Nitride	VN	2320	6.13	—	—	—	—			
Vanadium Pentoxide	V <sub>2</sub> O <sub>5</sub>	690	3.36	—	—	—	~500	eBeam (good)	W, graphite	Thin films prepared from powdered source material are nearly stoichiometric. Post process annealing at 280° in O <sub>2</sub> restores full stoichiometry
Vanadium Silicide	VSi <sub>2</sub>	1700	4.42	—	—	—	—	—	—	—
Ytterbium	Yb	824	6.98	—	520	590	690	eBeam (good)	Al <sub>2</sub> O <sub>3</sub> , W, Ta	Store Yb evaporation source material in N <sub>2</sub> desiccator to mitigate oxidation
Ytterbium Fluoride	YbF <sub>3</sub>	1157	8.17	—	—	—	~800			
Ytterbium Oxide	Yb <sub>2</sub> O <sub>3</sub>	2346	9.17	—	—	—	~1500	eBeam (fair)	Al <sub>2</sub> O <sub>3</sub> , W, Ta	Thin films produced by reactive evaporation in 8 x 10 <sup>-3</sup> torr O <sub>2</sub> have been reported.
Yttrium	Y	1509	4.48	—	830	973	1157			
Yttrium Aluminum Oxide	Y <sub>3</sub> Al <sub>5</sub> O <sub>12</sub>	1990	—	—	—	—	—	eBeam (good)	W, Al <sub>2</sub> O <sub>3</sub>	Films prepared from powdered source material, typically with dopants. YAG films post deposition annealed at 1100°C in vacuum improves crystallinity
Yttrium Fluoride	YF <sub>3</sub>	1387	4.01	—	—	—	—	eBeam (good)	W, Ta, Mo, Al <sub>2</sub> O <sub>3</sub>	eBeam evaporation at a rate of ≤ 10Å/sec and substrate temperature of 200°C produces crystalline films with good adhesion
Yttrium Oxide	Y <sub>2</sub> O <sub>3</sub>	2680	4.84	—	—	—	~2000	eBeam (good)	graphite, W	eBeam evaporated films can be oxygen deficient, post deposition annealing in 10 <sup>-3</sup> torr O <sub>2</sub> at 525°C results in stoichiometric films.
Zinc	Zn	419	7.14	0.514	127	177	250			
Zinc Antimonide	Zn <sub>3</sub> Sb <sub>2</sub>	546	6.3	—	—	—	—	eBeam (XInt)	W, Al <sub>2</sub> O <sub>3</sub> , quartz, graphite	Evaporates well under a wide range of conditions
Zinc Bromide	ZnBr <sub>2</sub>	394	4.22	—	—	—	~300	—	—	—
Zinc Fluoride	ZnF <sub>2</sub>	87	4.84	—	—	—	~800	eBeam (fair)	quartz, W	Thin films prepared by eBeam evaporation of powdered source material have been reported. Substrate heating at 400°C improved crystallinity
Zinc Nitride	Zn <sub>3</sub> N <sub>2</sub>	—	6.22	—	—	—	—	—	—	Reactive sputter deposition in N <sub>2</sub> has been reported

Material	Symbol	Melting Point °C	Density (bulk, g/cm <sup>3</sup> )	Z-ratio	Temperature °C @ Vapor Pressure (Torr)			Evaporation Method	Crucible Liner	Remarks
					10 <sup>-3</sup>	10 <sup>-6</sup>	10 <sup>-4</sup>			
Zinc Oxide	ZnO	1975	5.61	—	—	—	~1800	eBeam (fair)	quartz, W	Quality thin films fabricated using eBeam evaporation at a rate of 8Å/sec and a substrate temperature of 300°C has been reported
Zinc Selenide	ZnSe	1526	5.42	—	—	—	660	eBeam (fair)	W, Ta, Mo, quartz	Deposition rate of ≤ 5 Å/sec. Thin films are polycrystalline and a substrate temperature of 300°C improves adhesion and size of crystallites
Zinc Sulphide	ZnS	1830	4.09	—	—	—	~800	eBeam (good)	W, Ta, Mo, quartz	Thin films produced by eBeam evaporation display a preferred (111) orientation and best optical properties result from a 400°C substrate temperature
					sublimes					
Zinc Telluride	ZnTe	1238	6.34	—	—	—	~600	eBeam (fair)	W, Ta, Mo, quartz	Stoichiometric thin films produced by eBeam evaporation have good crystallinity with a substrate temperature of 230°C. Optical properties are thickness dependent
Zircon	ZrSiO <sub>4</sub>	2550	4.56	—	—	—	—	—	—	—
Zirconium	Zr	1852	6.4	—	1477	1702	1987	eBeam (XInt)	W, quartz	Alloys with W. Thin films oxidize readily
Zirconium Boride	ZrB <sub>2</sub>	3040	6.08	—	—	—	—	eBeam (good)	W, quartz	Stoichiometric films prepared by co-evaporation of Zr and B have been reported
Zirconium Carbide	ZrC	3540	6.73	—	—	—	~2500	eBeam (poor)	graphite	Quality thin films of ZrC using pulsed laser deposition have been reported
Zirconium Nitride	ZrN	2980	7.09	—	—	—	—	—	—	Thin films of ZrN prepared by N <sub>2</sub> ion assisted evaporation of Zr have been reported
Zirconium Oxide	ZrO <sub>2</sub>	2700	5.49	—	—	—	~220	eBeam (good)	W, graphite	Reactive evaporation in 10 <sup>-3</sup> torr O <sub>2</sub> produce as deposited stoichiometric films. For eBeam evaporated films, post deposition annealing in O <sub>2</sub> restores stoichiometry
Zirconium Silicide	ZrSi <sub>2</sub>	1700	4.88	—	—	—	—	—	—	eBeam evaporated Zr on Si substrates forms ZrSi <sub>2</sub> following post deposition thermal annealing at 600°C
